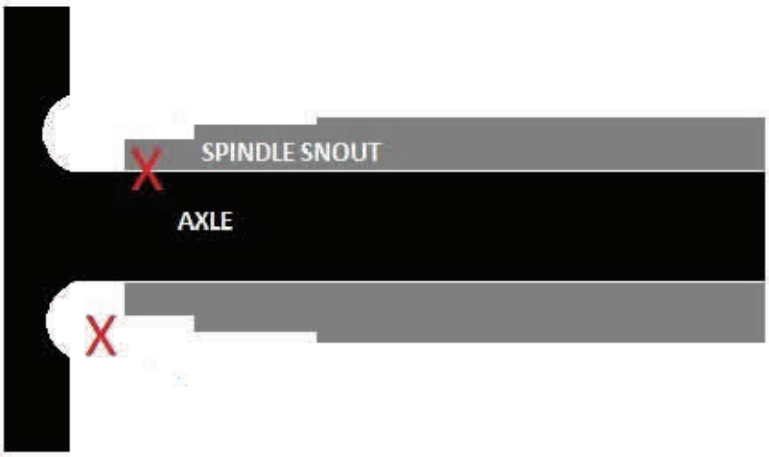
Important Information Regarding Your New Moser Full Floater Axles

!WARNING!



Moser Engineering Alloy floater axles are ***NOT*** tapered like the stock axles. Be sure to check for clearance at the "**X**" points! You may have to open up the spindle hole on the factory housing as the factory didn't always bore the holes concentric to the spindle end. You also may have to grind a little from the snout end to allow for clearance. The axle should not rub anywhere or it could gauld. The Moser axles you have purchased are a premium material and maximized for strength by keeping as much material as possible on the shaft. **DO NOT** machine the axles. Any alteration to the axles could severely weaken the shafts and cause damage or failure.
